# IMPLEMENT CODE OPTIMIZATION TECHNIQUES CONSTANT FOLDING

#### AIM:

To write a C program to implement Constant Folding (Code optimization Technique). **ALGORITHM:** 

- The desired header files are declared.
- The two file pointers are initialized one for reading the C program from the file and one for writing the converted program with constant folding.
- The file is read and checked if there are any digits or operands present.
- If there is, then the evaluations are to be computed in switch case and stored.
- Copy the stored data to another file. Print the copied data file.

#### PROGRAM:

```
#include
<stdio.h> #include <string.h>
#include <ctype.h>
void main() { char
s[20]; char
  flag[20] =
  "//Constant"; char result,
  equal, operator; double op1,
  op2, interrslt; int a, flag2 =
  0; FILE *fp1, *fp2; fp1 =
  fopen("input.txt", "r"); fp2 =
  fopen("output.txt",
      "w"); fscanf(fp1, "%s",
  s); while (!feof(fp1)) { if
  (strcmp(s, flag) == 0) \{ flag2 \}
  = 1;
    if (flag2 == 1) { fscanf(fp1, "%s", s);
      result = s[0]; equal = s[1]; if
      (isdigit(s[2]) \&\& isdigit(s[4])) \{ if (s[3] == '+' || s[3] \}
         == '-' || s[3] == '*' || s[3] == '/') { operator = s[3];
         op1 = s[2] - '0'; op2 = s[4] - '0'; switch (operator)
         { case
```

Roll Number: 210701115

```
break; case '-': interrslt
           = op1 - op2; break;
             case '*':
                interrslt = op1 * op2;
             break; case
             '/':
                if (op2 != 0)
                  interrslt = op1 / op2;
                else {
                  fprintf(fp2, "Division by zero
                  error.\n");
                                   fclose(fp1);
                  fclose(fp2)
                  ; return;
               }
                break
             default: interrslt
                = 0; break;
           }
           fprintf(fp2,
                         "/*Constant
                                          Folding*/\n");
           fprintf(fp2, "%c = %.2lf\n", result, interrslt);
           flag2 = 0;
         }
       } else { fprintf(fp2,
         "Not
         Optimized\n"); fprintf(fp2,
         "%s\n", s);
    } else { fprintf(fp2,
       "%s\n", s);
    fscanf(fp1, "%s", s);
  fclose(fp1); fclose(fp2);
}
OUTPUT:
Roll Number: 210701115
```

'+': interrslt = op1 + op2;

```
(kali@ kali)-[~/Documents/cdlab]
$ vi input.txt

(kali@ kali)-[~/Documents/cdlab]
$ vi exp9.c

(kali@ kali)-[~/Documents/cdlab]
$ gcc exp9.c

(kali@ kali)-[~/Documents/cdlab]
$ ./a.out

(kali@ kali)-[~/Documents/cdlab]
$ vi output.txt
```

## Input.txt:

```
//Constant
x=1+4
//Constant
y=a+b
//Constant
z=10+2
```

## **Output.txt:**

```
/*Constant Folding*/
x = 5.00
Not Optimized
y=a+b
Not Optimized
z=10+2
```

### **RESULT:**

Thus, a C program to implement Constant Folding has been developed.
